Silver Falcon Mining, Inc. (SFMI): Reports Millable Grades From Assays

BRADENTON, FL -- (MARKET WIRE) – 02/11/08 -- Silver Falcon Mining, Inc. (Other OTC: [SFMI.PK](#) - [News](#)) today released the results of an independent sampling analysis, conducted by Met-Solve Laboratories, Inc, of Burnaby, BC, Canada, on the initial production target area on its War Eagle gold project.

The independent analysis program was conducted on the Poorman Mine tailings sampling. The Poorman's tailings, are considered to be the least valuable source of precious metals and are targeted for use in the initial production at the milling plant. Sampling analysis indicates that the target area contains a good percentage of gold with a majority of free-milling silver ore in a native state, a highly unusual and rare form. A silver ore is either free-milling or refractory; i.e., the silver mineral is native or a chloride / sulphide combination. The native form is the simplest form to recover, but the least abundant form found in typical mines.

Mr. Pierre Quilliam, president stated that "we were definitely surprised and pleased by the results of the chemical analysis done on the samples from the Poorman Mine tailings. However, the results would explain a great deal about why there was prolific silver production from the Poorman Mine. According to Met-Solve Labs, the samples from the Poorman's tailings contain 3.3 g/ton Gold and 94.5 g/ton Silver. Since the sample analyzed was from a random selection of tailings, the average value in the waste reserves could be higher than the tested samples. Based upon these sampling results, the Poorman tailings are profitable and we look forward to receiving future reports on the more valuable ore from within the Poorman mine and its veins." He further states, that the War Eagle Mountain has numerous other tailings throughout the mining site that will be assayed in the very near term.
